Version 1.0

Solution

Following are the steps:

1. Open the Data flow task in a package

2. Set a destination adaptor for the error to store

3. Select the task/ transformation where error would occur during data flow

4. Drag the red arrow from task/transformation to the destination adaptor

5. Now configure the error output from the task/transformation editor

6. Select the error option as redirect row.
7. Then click on OK

8. Now execute the package, error if found is send to destination adaptor/ flat file
